Price Management 2026/2027 · Pricing Project

Prompt Pack

Build the website for your case in eight steps

These prompts build the website for your case with your AI coding assistant (Codex or Claude Code, see the Setup Guide). The website is only the stage: your real task is the **pricing strategy** – the assistant builds the page, you decide the prices and defend them in your report.

Before you start: open your repository folder **pricing-project** in VS Code. Use the prompts **in this order**. Replace **every** text in square brackets, e.g. [COMPANY NAME], with the information from your case or your own pricing decisions, and delete the brackets.

Save requests – the free plans have limits

- Start a **new chat** for every prompt. Each prompt says which file and which part to change, so the assistant does not need the old conversation – and a short conversation uses fewer requests.
- Send each prompt **once**, complete. Do not ask the assistant to explain the code, and do not ask it to rewrite the whole page after prompt 1.
- If something is wrong, use prompt 6 for **one** problem at a time, described exactly (what, where, what you expected).
- Accept the assistant's changes only after you have looked at them (Setup Guide, Rules).

Prompt 1 · Build the whole website in one step

What it does: Creates the complete one-page website in one file, index.html: menu, headline, benefits, how it works, an empty pricing section, FAQ and contact. Everything the assistant needs is in this one prompt, so it does not have to ask questions.

```
Create a simple, clean one-page website in this folder.

Company: [COMPANY NAME]
What we sell (one sentence): [PRODUCT OR SERVICE]
Description (3–5 sentences): [PRODUCT DESCRIPTION]
Customers: [TARGET CUSTOMERS]
Main benefits: [BENEFIT 1]; [BENEFIT 2]; [BENEFIT 3]
How it works (3 steps): [STEP 1]; [STEP 2]; [STEP 3]
Brand colour: [COLOUR NAME AND HEX CODE, e.g. dark green #1B5E20]
Contact e-mail (made up): [E-MAIL, e.g. hello@example.com]

Rules:
- One file only: index.html, with all CSS in one <style> block. No frameworks, no external
libraries, fonts, images, icons or scripts. Use system fonts.
- Sections in this order, each with its id: a header with the company name and a menu linking
to #benefits, #how, #pricing, #faq and #contact; a hero with a headline, one sentence and a
button to #pricing; Benefits (#benefits); How it works (#how); Pricing (#pricing) with only
the heading "Pricing" and the HTML comment <!-- PRICING --> for now; FAQ with 4 short
questions and answers (#faq); Contact (#contact) with the e-mail; a footer: "© 2026 [COMPANY
NAME] – student project, fictitious company".
- Mobile-friendly from the start: a viewport meta tag, max width about 1100 px, no horizontal
scrolling on a 375 px phone.
- Readable everywhere: normal text at least 16 px, small print at least 14 px; buttons and
menu links at least 44 px high.
- Plain, professional look with plenty of white space; use the brand colour for buttons and
headings.
- All texts in English, based only on the information above. Do not invent prices, numbers,
features, customer names or testimonials.
- No passwords, API keys or personal data.

Create the file now. Do not explain the code; when you are done, reply with one sentence.
```

Check afterwards

- The file **index.html** exists in your folder, and there is no other new file.
- Open it in your browser (Setup Guide, Step 6): all menu links jump to their sections, and the pricing section shows only its heading.
- No prices, numbers, features, customer names or testimonials were invented – the FAQ promises nothing that is not in your case.

Prompt 2 · Add your pricing

What it does: Fills the pricing section with the offers of your pricing strategy – names, prices, units, conditions and the value message. Only this section changes.

```
In index.html, replace the comment <!-- PRICING --> in the #pricing section with my pricing.
Change nothing outside the #pricing section.

Offers – one line each: name – price – price unit – who it is for – what is included:
[OFFER 1]
[OFFER 2]
[OFFER 3]
(Delete the lines you do not need, or add lines for more offers.)
Highlight as recommended: [OFFER NAME]
Conditions and discounts (one line): [CONDITIONS, e.g. annual billing –15%; volume prices from
10 users]
Value message under the heading (one sentence): [VALUE MESSAGE]
Price note: [e.g. All prices include VAT / All prices exclude VAT]

Show the offers as cards of equal width in one row on a computer (up to 4 offers) and one
below the other on a phone. Each card gets a button with the word "Choose" and the offer name
(e.g. "Choose Basic") that links to #contact. Put the conditions and the price note in one
small line under the cards. Use exactly my names, prices and units – do not change or round
them. Reply with one sentence.
```

Check afterwards

- Every offer shows **exactly** your name, price and price unit (e.g. per user per month) – nothing rounded or changed.
- The recommended offer is highlighted, every button jumps to the contact section, and the conditions line is under the offers.
- The rest of the page has not changed.

Prompt 3 · Optional: a small price calculator

What it does: Only if your price depends on quantity or use (e.g. per user, per kg, per km): adds a small calculator under the offers so that customers can see their own price. Skip this prompt if your prices are fixed.

```
In index.html, add a small price calculator at the end of the #pricing section. Change nothing
else.

The customer enters: [INPUT, e.g. number of users per month]
Price rule: [RULE IN WORDS, e.g. €49 per month for up to 10 users, plus €4 for each further
user]
Show the result as: [LABEL, e.g. "Your monthly price"], in euros with 2 decimals.

Use a few lines of plain JavaScript in one <script> block at the end of the body, no
libraries. Empty, negative or non-numeric input shows "Please enter a number". Reply with one
sentence.
```

Check afterwards

- Try three values yourself and compare the results with your own calculation in Excel or on paper.
- Zero, empty and very large values do not break the page.

Prompt 4 · Change texts

What it does: Replaces the texts you want to improve – for example a better headline, a benefit written in the language of your target customers, or a FAQ answer about your price conditions. Nothing else changes.

```
In index.html, make only these text changes and nothing else:
1. [WHERE, e.g. hero headline]: "[NEW TEXT]"
2. [WHERE, e.g. FAQ question 2 and its answer]: "[NEW TEXT]"
3. [WHERE]: "[NEW TEXT]"
(Delete the lines you do not need.)
Keep the layout, the styles and all other texts exactly as they are. Reply with one sentence.
```

Check afterwards

- Only the parts you named have changed, with your exact text.
- Prices and offers in the FAQ or elsewhere still match the pricing section.

Prompt 5 · Check the phone view

What it does: Checks the page for a phone screen and fixes only what breaks there – without touching your texts and prices.

```
Check index.html for a phone screen 375 px wide. Put all phone fixes in one @media (max-width:
600px) block at the end of the <style> block, so that on a phone: nothing is wider than the
screen (no sideways scrolling); normal text is at least 16 px and small print at least 14 px;
every menu link, button and input is at least 44 px high; the menu fits the screen (it may
wrap to two lines); the offer cards are below each other. Do not change texts, prices or
colours. Reply with at most 5 short lines, one per fix, or "No changes needed".
```

Check afterwards

- Open the page on your phone, or in the browser press F12 and choose a phone size: no sideways scrolling, the offers are below each other, the text is readable and the buttons are easy to tap.

Prompt 6 · Fix one problem

What it does: Fixes one problem that you describe exactly. Use it as often as you need, but always for one problem at a time.

```
There is a problem in index.html: [WHAT YOU SEE, WHERE, AND WHAT YOU EXPECTED – e.g. "On the
phone, the right edge of the Pro card is cut off; the card should fit the screen"]. Fix only
this problem and change nothing else. Reply with one sentence.
```

Check afterwards

- The problem is gone, and nothing else on the page has changed.

Prompt 7 · Final check before publishing

What it does: Looks for the typical mistakes before you publish: forgotten square brackets, links that go nowhere, prices that differ between two places, and anything loaded from the internet.

```
Check index.html before I publish it and fix only these problems: text left in square brackets
[ ], links or buttons that do not lead to an existing section or to the e-mail address, offer
names or prices that differ between the pricing section and the rest of the page, sentences
that promise a feature or a free service that the offers do not include, and anything loaded
from the internet (fonts, images, scripts, styles). Change nothing else. Reply with one short
line per fix, or "No changes needed".
```

Check afterwards

- Read the reply: every fix makes sense to you. The assistant may rewrite a sentence so that it matches your offers (e.g. "offline" only in paid plans) – check that the new sentence is true for your case.
- Open the page once more and click through all links and buttons.

Prompt 8 · Publish

What it does: Saves your work on GitHub (commit and push). Your website then goes online with GitHub Pages – switch it on once, as in the Setup Guide (Step 6).

```
Commit all changes in this folder with the message "[MESSAGE, e.g. Website and pricing for
COMPANY NAME]" and push them to the main branch of my GitHub repository. Do not change any
files. Reply with one sentence.
```

Check afterwards

- The assistant asks for permission to run git commands (add, commit, push) – allow them. If the push fails, read its message and see "Sync/Push is rejected" in the Setup Guide (Troubleshooting).
- On github.com your repository shows the new index.html.
- After 1–3 minutes the page is online at https://[your username].github.io/pricing-project/ – open it on your phone.
