Price Management 2026/2027

Pricing Project

Setup Guide: GitHub, Git, VS Code and your AI coding assistant

Tool set-up workshop: **Saturday, 3 October 2026** · Project week: **5–11 October 2026**

Please read this guide and, if you can, complete Steps 1–4 at home before the workshop. At the workshop we finish the set-up together and every student completes the first test.

1. Overview

In the pricing project you work on your own and are assessed individually. You receive a **ready-made case** – a company with a digital or green product or service – and design its **pricing strategy**. During the project week you build a simple website for the company with a pricing section, write a 3-page report, and afterwards present your work. You build the website with an **AI coding assistant** and the **Prompt Pack**: ready-made prompts in plain English – the assistant writes the code, and you check the result. This way of working is often called **vibe coding**. You do not need any programming experience.

This guide only covers the tools and accounts. Your task is described in the **Project Brief**, your case in the **Case Book** and the prompts for your website in the **Prompt Pack** – all on Loomen.

What you will set up

- a **GitHub** account – where you store your code and publish your website,
- **Git** – the program that sends your changes to GitHub,
- **Visual Studio Code (VS Code)** – the editor where you and the AI assistant work,
- an **AI coding assistant** inside VS Code – **Codex** (free ChatGPT account) or **Claude Code** (only if you already pay for Claude).

> **You do not have to pay for anything**
> GitHub, Git and VS Code are free. The Codex extension works with a free ChatGPT account. Claude Code is only for students who already have a paid Claude plan. Please do not buy any subscription or credits for this course.

How the project is assessed

The Project Brief contains the full rubric. In short, you are assessed individually on the pricing strategy of your case and how well you justify it with the facts of the case and the course concepts, on the website with its pricing section, the 3-page report and the presentation – not on this set-up and not on programming.

The pricing project is a condition

Submitting the pricing project by the deadline – the end of the project week, **Sunday 11 October 2026, 23:59** – is a condition for taking the mid-term exams and the final exam in all exam terms of the academic year 2026/2027.

There is **no resubmission**, and a project submitted after the deadline is **not accepted**.

A student who does not submit the project by the deadline **cannot take any assessment** in 2026/2027 and must re-enrol in the course in the following academic year.

There is **no minimum score** for the project: it earns the points the student achieves.

2. What you need

- A **laptop with Windows 10 or 11, or macOS**. For Claude Code, macOS 13 (Ventura) or newer is required. **Chromebooks and iPads are not supported.**
- A **stable internet connection**.
- About **60 minutes**.
- An **e-mail address** you can open right away, and your **phone** for two-factor authentication (2FA).

3. Step 1 – GitHub account

1. Open github.com/signup.
2. Enter your **e-mail address** and create a **password**.
3. Choose your **username** (see the tip below).
4. Solve the short puzzle and click **Create account**.
5. Open the e-mail from GitHub and enter the **verification code** on the GitHub page.
6. If GitHub asks about your plans or interests, you can click **Skip personalization**. The free plan is all you need.

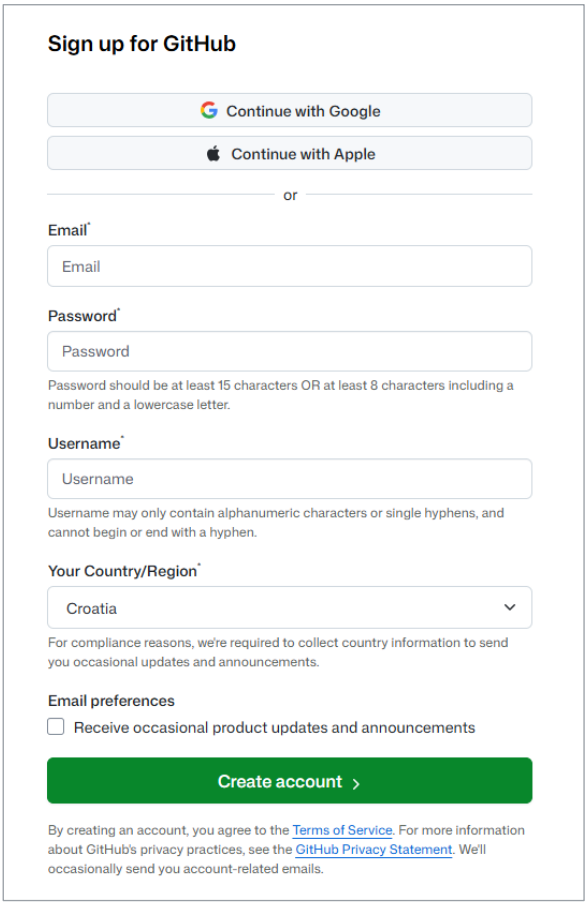

Tip: choose a professional username

Your username becomes part of your public website address (**username.github.io**) and future employers may see it. Use something like **ana-horvat** or **ahorvat**. Avoid nicknames, jokes and birth years. You can use this account after the course as a portfolio.

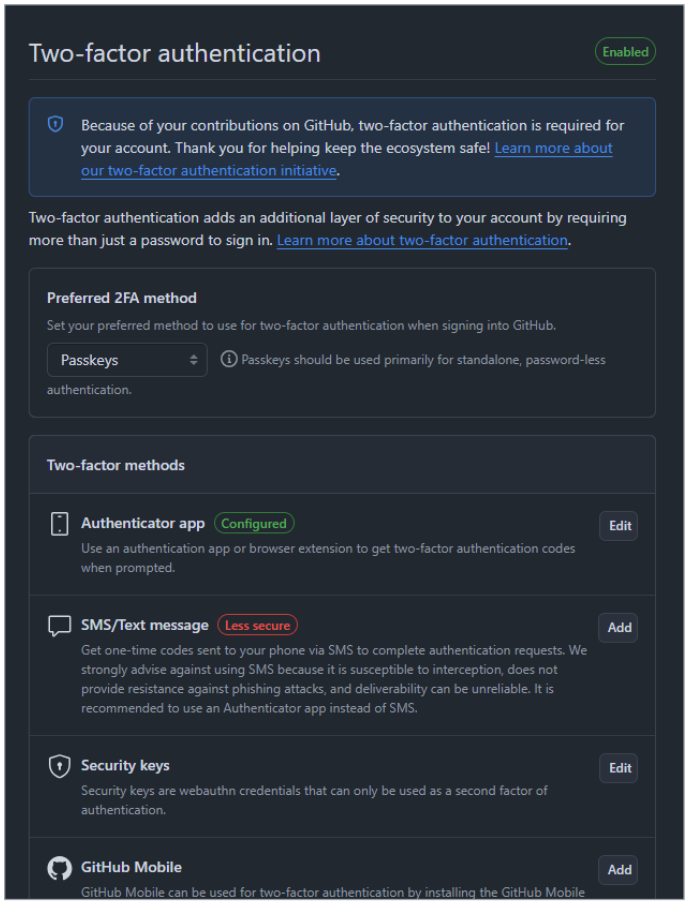

Turn on two-factor authentication (2FA)

GitHub requires two-factor authentication for accounts that contribute code, so it is best to switch it on now.

1. Install an authenticator app on your phone, for example **Microsoft Authenticator** or **Google Authenticator**.
2. On GitHub, click your **profile picture** (top right) and choose **Settings**.
3. In the left menu, click **Password and authentication**.
4. Click **Enable two-factor authentication**.
5. Scan the **QR code** with the authenticator app and type the 6-digit code.
6. Click **Download** to save your **recovery codes** and keep them somewhere safe.

GitHub sign-up page with e-mail, password and username fields

Two-factor authentication already enabled – on a new account, click "Enable two-factor authentication" and follow the guide

4. Step 2 – Install Git

Windows

1. Open git-scm.com/downloads/win and download **Git for Windows** (64-bit installer).
2. Run the installer. Click **Next** on every screen – the default options are fine.
3. On the screen about the PATH, keep the recommended option **Git from the command line and also from 3rd-party software**.
4. Click **Install** and then **Finish**.
5. Open **PowerShell** (press the **Start** button, type **PowerShell**, press **Enter**) and type:

```
git --version
```

You should see something like `git version 2.x`. Claude Code also recommends Git for Windows, so this step is useful for both assistants.

macOS

1. Open **Terminal** (press **Cmd + Space**, type **Terminal**, press **Return**) and type:

```
git --version
```

2. If Git is not installed yet, macOS offers to install the **Command Line Developer Tools**. Click **Install** and wait until it finishes.
3. Type `git --version` again. You should now see a version number.

Both systems: tell Git who you are

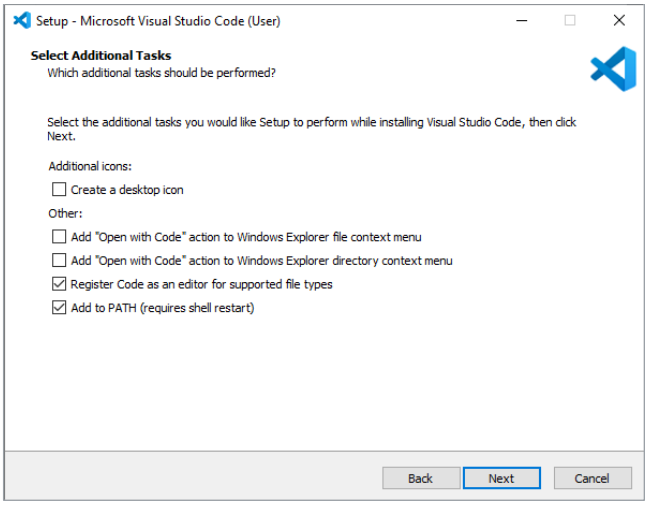

In PowerShell (Windows) or Terminal (macOS), type these two lines with **your own** name and the **same e-mail as your GitHub account**:

```
git config --global user.name "Ana Horvat"
git config --global user.email "ana.horvat@example.com"
```

5. Step 3 – Install Visual Studio Code

Windows

1. Open code.visualstudio.com/download and click **Windows** (User Installer, x64; choose Arm64 only if your laptop has an ARM processor).
2. Run the installer and accept the licence agreement.
3. On the screen **Select Additional Tasks**, make sure **Add to PATH** is checked. It is also useful to check **Add "Open with Code" action**.
4. Click **Install**, then **Finish**. VS Code opens.

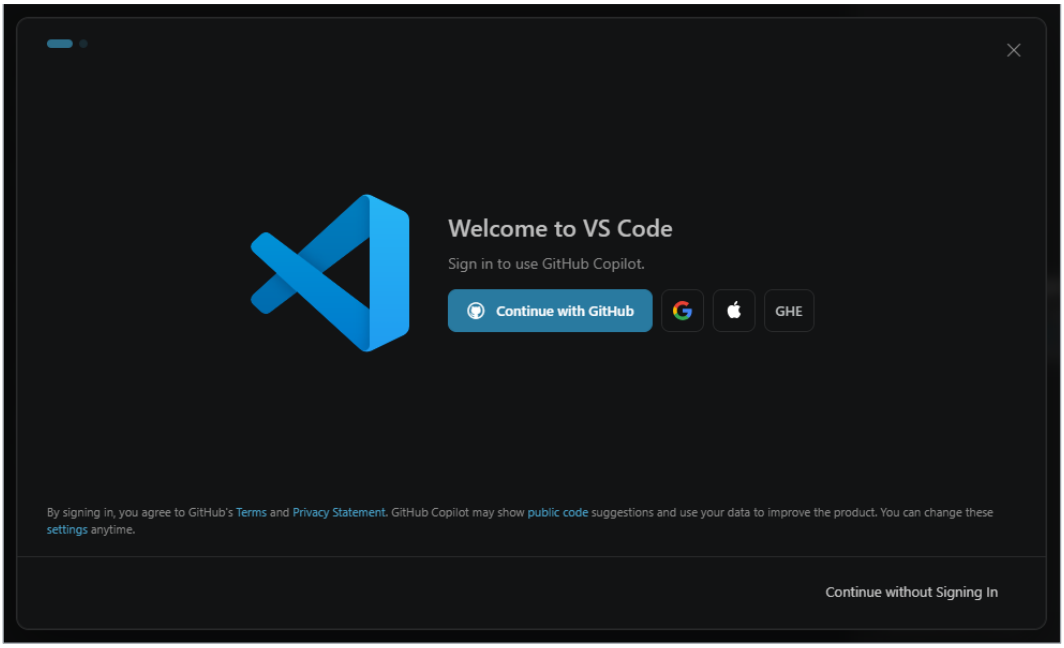

VS Code installer – Select Additional Tasks with "Add to PATH" checked

macOS

1. Open code.visualstudio.com/download and click **Mac** (Universal).
2. Open your **Downloads** folder and double-click the downloaded **.zip** file.
3. Drag **Visual Studio Code** into the **Applications** folder.
4. Open VS Code from **Applications**. If macOS asks whether you want to open it, click **Open**.
5. Optional: press **Cmd + Shift + P**, type **Shell Command: Install 'code' command in PATH** and press **Return**.

Both systems: the first start

When you start VS Code for the first time, it shows the screen **Welcome to VS Code** and offers to sign in to use **GitHub Copilot**. Click **Continue without Signing In** (bottom right): for the project you use Codex or Claude Code (Step 4), not Copilot. You sign in to GitHub later, when you clone your repository in Step 5 – VS Code then opens your browser.

VS Code welcome screen with "Continue without Signing In"

Check the version

Claude Code needs **VS Code 1.98.0 or newer**. On Windows choose **Help → About**, on macOS **Code → About Visual Studio Code**. If your version is older, choose **Check for Updates** in the same menu.

6. Step 4 – Your AI coding assistant

Which assistant should I use?

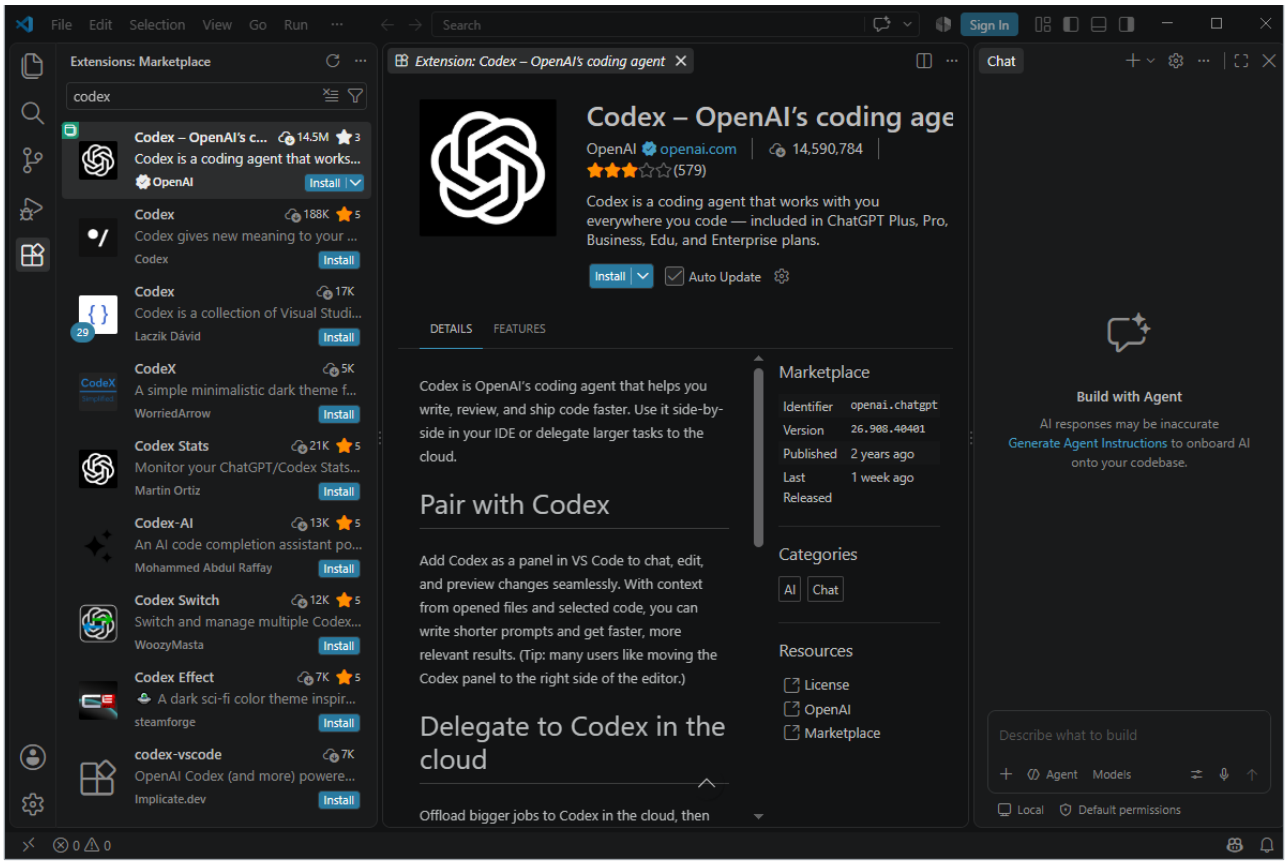

- You **already pay for Claude** (Pro plan or higher) → use **Claude Code** (Option B).
- **Everyone else** → use **Codex** with a **free ChatGPT account** (Option A).

Nobody has to pay.

Option A – Codex (free ChatGPT account)

1. Open chatgpt.com and click **Sign up** to create a free account (or **Log in** if you already have one). The free plan is enough.
2. In VS Code, open the **Extensions** view: **Ctrl + Shift + X** (Windows) or **Cmd + Shift + X** (macOS).
3. Search for **Codex** and install **Codex – OpenAI's coding agent**. Check that the publisher is **OpenAI**.
4. Click the **Codex** icon in the side bar. If you do not see it, press **Ctrl/Cmd + Shift + P** and run **Codex: Open Codex Sidebar**.
5. Click **Sign in with ChatGPT**. Your browser opens – log in and confirm, then return to VS Code.
6. Type a short test message, for example **Say hello in one sentence**, and check that Codex answers.

The extension page may list only paid ChatGPT plans. Codex also works with a **free ChatGPT account**, with a limited number of requests.

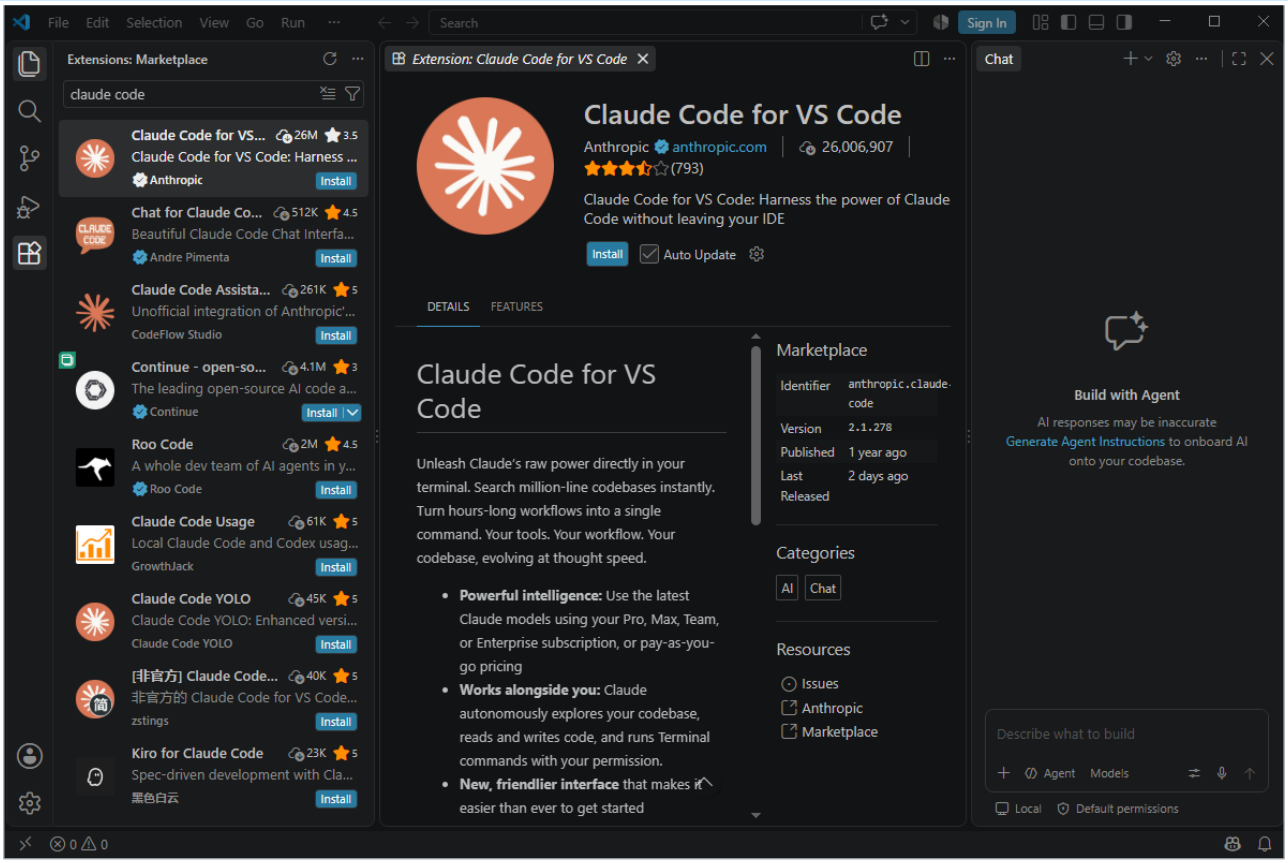

VS Code Extensions view with "Codex – OpenAI's coding agent" by OpenAI

> **What if I reach the usage limit?**
>
> Codex is included in the free ChatGPT plan with small usage limits. When you reach the limit, Codex shows a message with options. **Do not buy credits.** Instead, wait until the limit resets and, in the meantime, work on your pricing model and your report.

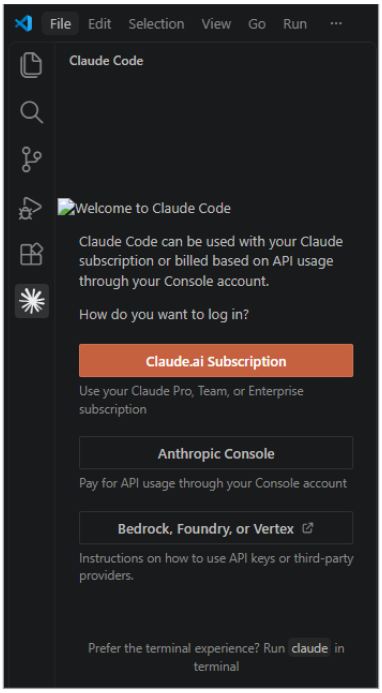

Option B – Claude Code (only with a paid Claude plan)

Claude Code is **not** included in the free Claude plan. It works with the **Pro** plan or higher. If you do not already pay for Claude, use Option A.

1. In VS Code, open the **Extensions** view (**Ctrl/Cmd + Shift + X**).
2. Search for **Claude Code** and install **Claude Code for VS Code**. Check that the publisher is **Anthropic** (first screenshot below).
3. Open a file, then click the **Spark** icon in the top-right corner of the editor (or in the side bar).
4. Under **How do you want to log in?** click **Claude.ai Subscription** (for the Pro plan or higher) and complete the sign-in in your browser with your Claude account (second screenshot below). Do not use **Anthropic Console** or **Bedrock, Foundry, or Vertex** – they are for paid API use, not for your Claude plan.

VS Code Extensions view with "Claude Code for VS Code" by Anthropic

Claude Code panel in VS Code: "How do you want to log in?" – choose "Claude.ai Subscription"

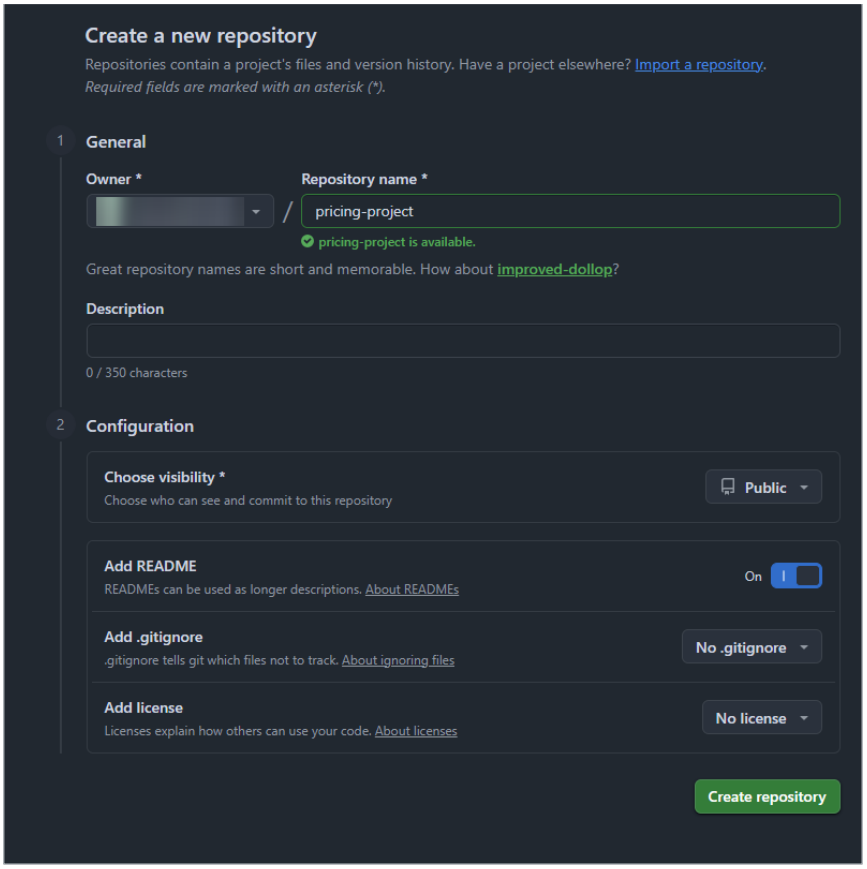

5. Type a short test message and check that Claude answers.

On Windows, make sure you completed Step 2: Claude Code recommends **Git for Windows**.

7. Step 5 – Connect VS Code to GitHub

Create your repository

1. On github.com, click **+** (top right) and choose **New repository**.
2. Enter the **Repository name pricing-project** (lowercase letters and a hyphen; do not add your name).
3. Choose **Public**. Free GitHub accounts can publish websites only from public repositories – that is why nothing secret or personal may ever go into it (see Rules).
4. Switch **Add README** to **On**.
5. Click **Create repository**.

Create a new repository: pricing-project, Public, "Add README" on

You do not need to add anyone to your repository. It is public, so you simply enter its link on Loomen (see Step 6 and Section 12).

Clone your repository in VS Code

1. In VS Code, press **Ctrl/Cmd + Shift + P**, type **Git: Clone** and press **Enter**.
2. Choose **Clone from GitHub**. VS Code asks you to sign in to GitHub – click **Allow**, confirm in the browser and return to VS Code.
3. Select your repository **pricing-project** from the list.
4. Choose a folder on your laptop, for example **Documents**, and click **Select as Repository Destination**.
5. Click **Open** when VS Code asks whether to open the cloned repository. You should see **README.md** in the Explorer on the left.

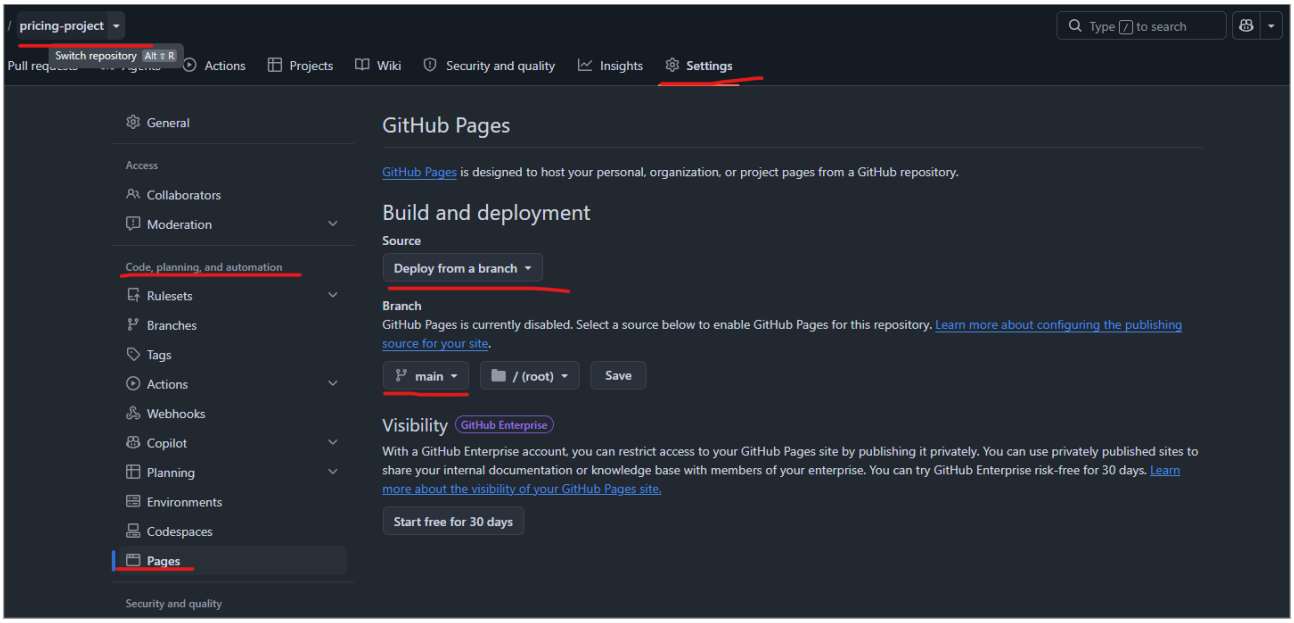

8. Step 6 – First test: "Hello, pricing!"

Complete this test **before the project week**. At the end, your page is online at a public web address.

1. Open your repository in VS Code and open your AI assistant.
2. Copy the prompt below, replace **[YOUR NAME]** with your name and send it:

```
Create a simple one-page website in this folder. Make one file called index.html
with HTML and CSS only (no frameworks, no build step). The page should show the
heading "Hello, pricing!", my name "[YOUR NAME]", and a small pricing table with
three plans (Free, Basic, Pro) for a fictional app, each with a monthly price in
euros and three features. Make it clean and easy to read on a phone. Do not add any
passwords, API keys or personal data.
```

3. Read what the assistant plans to do and **accept** the changes. A new file **index.html** appears.
4. Check the page: right-click **index.html** in the Explorer, choose **Reveal in File Explorer** (Windows) or **Reveal in Finder** (macOS) and double-click the file.
5. Open **Source Control** (**Ctrl + Shift + G** or **Cmd + Shift + G**), type the message **First test: Hello, pricing!** and click **Commit**. If VS Code asks whether to stage all changes, click **Yes**.
6. Click **Sync Changes** (or **Push**) to send your work to GitHub.
7. Open your repository on github.com and click **Settings → Pages**.
8. Under **Build and deployment → Source**, choose **Deploy from a branch**, select **main** and **/ (root)**, and click **Save**.
9. Wait 1–3 minutes and refresh the page until you see **Your site is live at** followed by an address like **https://username.github.io/pricing-project/**.
10. Open this address on your **phone**. If you see "Hello, pricing!", the test worked.
11. On Loomen, open the assignment **Pricing Project submission** and click **Add submission**. In the text field, enter the link to this page and the link to your repository, then click **Save changes**. Do **not** click **Submit assignment** yet: you submit once, with your report, by **Sunday 11 October 2026, 23:59** (Project Brief, Section 4).

Repository Settings → Pages with "Deploy from a branch", main and /(root)

After this test you build the website of your case with the **Prompt Pack** – the same folder, the same publishing steps. Ask questions about the course material and the project in the Loomen forum **Questions & Answers**; use e-mail (**leonarda.srdelic@zsem.hr**) only for personal matters such as illness, excused absences or personal data.

9. Working on your project

- **Decide your prices first**, then build: the pricing section shows exactly the strategy of your report.
- **Use the Prompt Pack** – the eight prompts in order, a new chat for each prompt. This saves requests of the free plan.
- **Check your website after each prompt** on a computer and on a phone.
- **Click Sync Changes regularly** – commit and sync after every bigger change, so your work is saved on GitHub.
- **Plan your work over the week**, so that the limit of the free plan does not hit you on the last day.
- **Your pricing model and your report do not depend on the AI assistant** – work on them when you have reached the limit.

10. Rules

- **Never put passwords, API keys or tokens in your code** or anywhere in the repository. Your repository and your website are public.
- **Do not enter personal data of other people** (names, e-mails, phone numbers, customer lists) into your website or into the AI assistant. Use made-up example data.
- **End your report with a short AI statement** (3–5 sentences, not counted in the 3 pages) saying which AI tools you used and what for, e.g. building the app, checking calculations or editing the text.
- **Your website must have a pricing section** that shows exactly the pricing strategy of your case (Prompt Pack, prompt 2).
- **Check what the assistant changes** before you accept it. You are responsible for your code.
- **You are responsible for everything you submit** – the application, the pricing model, the report and the presentation – and you must be able to explain it at your presentation.
- **AI tools are not allowed in the mid-term exams and the final exam.** The ZSEM rules on academic integrity and plagiarism apply.

11. Troubleshooting

Problem	What to try
The extension does not sign in	Check whether your browser opened a sign-in tab (it may be behind VS Code). Log in on the website first (chatgpt.com or claude.ai), then start the sign-in in the extension again (Codex: **Sign in with ChatGPT**; Claude Code: **Claude.ai Subscription**). Restart VS Code. Claude Code: check that your VS Code is **1.98.0 or newer** and that you have a paid Claude plan.

Problem	What to try
"git" is not recognized / command not found	Install Git (Step 2). Close and reopen VS Code and PowerShell/Terminal; on Windows restart the laptop if needed. Check again with `git --version`.
You reached the limit of the free plan	Do not buy credits. Wait until the limit resets (the assistant shows when) and work on your pricing model and report in the meantime. Next time use shorter, more specific prompts.
GitHub Pages does not show the page (404)	Check that the repository is **Public**. Check **Settings → Pages**: **Deploy from a branch**, **main**, **/ (root)**. The start page must be called exactly **index.html** and be in the main folder. Wait a few minutes and refresh; check the **Actions** tab for a green tick. Check the address: the repository name must be written exactly as on GitHub.
Sync/Push is rejected	A file was changed directly on GitHub (for example **README.md** edited in the browser). Click **Sync Changes** to get that change first, then push again. If VS Code reports a conflict, ask your AI assistant to help you resolve it.

12. Checklist before the break

Complete this list at the workshop. Tick every box before the project week starts.

- ☐ I have a **GitHub account** with a confirmed e-mail and **two-factor authentication** on.
- ☐ I have installed **Git** (`git --version` works) and set **user.name** and **user.email**.
- ☐ I have installed **VS Code** (Claude Code users: version 1.98.0 or newer).
- ☐ I have installed my **AI assistant** and signed in (Codex or Claude Code).
- ☐ My repository **pricing-project** exists, is **Public** and has a README.
- ☐ I have **cloned** my repository and can open it in VS Code.
- ☐ My first test page **"Hello, pricing!"** is committed and pushed.
- ☐ **GitHub Pages** is on and my public link opens on my phone.
- ☐ I have saved the **link to my website** and the **link to my repository** in the Loomen assignment **Pricing Project submission** (a draft – I submit it with my report by 11 October, 23:59).

Facts checked on official pages on 21 September 2026

Plans, limits and menus change often. If something on screen looks different from this guide, follow the current instructions on the official page and tell the lecturer.
